Presentation of the new version of linux live cd wifislax

Wifislax64-3.4

One more version of Wi-Fislax, they are getting longer and longer, this time almost a year ago since Wi-Fislax-3.3, but there was no need to release anything before because there are no big novelties that justify it.

As always, cumulative slackware security patches have been applied, some wifi apps have been updated, such as airgeddon, wireshark, wifi etc.

As a "REAL" novelty, I can only point out the inclusion of the xfce desktop, eligible from the boot menu, and the inclusion of some extra language in addition to English and Spanish... such as French, Italian and German.

Those who have known me for a long time know that xfce is not my forte, although I have tried to make it usable enough, including extra apps to read pdf or use bluetooth through blueman.

XFCE , has the particularity that if we boot from a usb spike, we will not be able to access it directly from the side panel of thunar , although it appears , as the live is mounted from there , it has problems to access , so you will have to go to **/mnt/livemedia** to have access to the usb skewer and be able to write files if you

System components such as firmware, chrome, kernel, extra wifi drivers, java and so on were updated.

This version comes out with the newest stable kernel to date which is 6.6.4, this will surprise some since in the test isos the kernel of the 6.1 branch was distributed, but since the 6.6 kernel was recently named LTS, I have decided to go with it.

Any suggestions or improvements can be proposed in the forum, as well as if any problem is detected I ask you to report in the development section of our lives to try to solve doubts or problems.

Also remember that there are a variety of apps of different types packaged in the modules section, where you can add another browser or an office suite of your interest, if you need something you can ask for it in the development section and we will try to package it, with its dependencies included.

Modules are compressed files, such as a rar or a zip.. By copying them into the **Modules** folder, the system identifies and decompresses them during the start of the live, thus expanding their possibilities and covering the needs of those who want to use extra software.

Greetings and enjoy this new version, Merry Christmas early and all that.
